

PRACTICAL – 03

- 1) Create a Servlet Which gets color from init parameter and username from user and sets the background color of web browser with welcome message in center with Heading1 in response.
- 2) Create a login.html file which allows user to input username and password. Create a servlet that takes the username as password and check it with stored context parameters. If the user is valid then redirect to welcome servlet which shows a welcome message to user else redirect back to login.html. (Use sendRedirect).
- 3) Create a login.html file which allows user to input username and password. Create a servlet that takes the username as password and check it with stored config parameters. If the user is valid then redirect to welcome servlet which shows a welcome message to user else redirect back to login.html. (Use Request Dispatcher).
- 4) Write a simple servlet which counts the total number of visit on that URL and display it to user along with the request time, request URI, Protocol, PathInfo, IP Address.
- 5) Write a simple servlet which auto refresh at every second to show user the correct time on browser.
