1. Create a simple application in JSP which displays product list and price to user. User can select product and add them to cart. Cart will be managed using Session. Put a checkout button which can be used to view the final cart values. Also create a header section on all pages to display current date and time.
2. Create a html page which takes input from user like “a+b-c”. Write a simple bean class to take the input and process it to calculate necessary output.
3. Create a simple login application using MVC architecture. Use JSP page, Servlet and Simple Bean for the same. Collect the valid user names and passwords from Context/Application scope. If valid login than display welcome page else provide a valid error page.
